

Implementing semantic frames and constructions in GF

Normunds Grūzītis

REMU Retreat 2015

<http://remu.grammaticalframework.org/retreat/2015/>

FrameNet

- A lexico-semantic resource based on the theory of frame semantics (Fillmore et al., 2003)
 - A semantic **frame** represents a prototypical, language-independent situation characterized by **frame elements (FE)** – **semantic valence**
 - Frames are evoked in sentences by language-specific **lexical units (LU)**
 - FEs are mapped based on the **syntactic valence** of the LU
 - The syntactic valence patterns are derived from **FrameNet-annotated corpora** (for an increasing number of languages)
 - FEs are divided into **core** and **non-core** ones
 - Core FEs uniquely characterize the frame and syntactically correspond to verb **arguments**
 - Non-core FEs (**adjuncts**) are not specific to the frame

Example

Desiring	
Definition: An Experiencer desires that an Event occur. In some cases, the Experiencer is an active participant in the Event, and in such cases the Event itself is often not mentioned, but rather some Focal_participant which is subordinately involved.	
Core:	Event, Experiencer, Focal_participant, Location_of_Event
Non-core:	Cause, Degree, Duration, Manner, Place, Purpose_of_Event, Reason, Role_of_focal_participant, Time, Time_of_Event

BFN frames and FEs

want.v..6412

känna_för.vb..1

Examples	Valence patterns	
40	Event	Experiencer
(22)	VPto.Dep	NP.Ext
14	Experiencer	Focal_participant
(10)	NP.Ext	NP.Obj
(1)	PP [by].Dep	NP.Ext

Some valence patterns found in BFN

Examples	Valence patterns	
1	Event	Experiencer
(1)	VB.INF.VG	NN.SS
2	Experiencer	Focal_participant
(2)	NN.SS	NN.OO

Some valence patterns found in SweFN

FrameNet-based grammar in GF

- Existing FNs are not entirely formal and computational
 - We provide a **computational** FrameNet-based grammar and lexicon
- GF, Grammatical Framework (Ranta, 2004)
 - Separates between an **abstract syntax** and **concrete syntaxes**
 - Provides a general-purpose **resource grammar library** (RGL) for nearly 30 languages that implement the same abstract syntax
 - Large mono- and multilingual **lexicons** (for an increasing number of languages)
- The language-independent layer of FrameNet (frames and FEs) – the abstract syntax
 - The language-specific layers (surface realization of frames and LUs) – concrete syntaxes
- RGL is used for unifying the syntactic types used in different FNs
 - FrameNet allows for abstracting over RGL constructors

Initial aim

- Provide a shared FrameNet API to GF RGL, so that application grammar developers could primarily use semantic constructors
 - In combination with some simple syntactic constructors
 - But instead of comparatively complex constructors for building verb phrases

```
mkC1 person (mkVP (mkVP Live_V) (mkAdv in_Prep place))  
-- mkC1 : NP -> VP -> C1  
-- mkVP : V -> VP  
-- mkVP : VP -> Adv -> VP  
-- mkAdv : Prep -> NP -> Adv
```

Residence <i>person</i> (<i>mkAdv in_Prep place</i>) <i>Live_V_Residence</i>	-- Residence : NP -> Adv -> V -> C1 -- NP (Resident) -- Adv (Location) -- V (LU)
--	---

A FrameNet-based API to GF Resource Grammar Library

vers. 0.9.3

Desiring

Desiring_V : Experiencer_NP → Focal_participant_Adv → V → Clause

- ▶ Eng: [he]Experiencer [WANTED] [more]Focal_participant
 - ▶ **aspire_V_Desiring : V**
 - ▶ **hanker_V_Desiring : V**
 - ▶ **hunger_V_Desiring : V**
 - ▶ **long_V_Desiring : V**
 - ▶ **lust_V_Desiring : V**
 - ▶ **pine_V_Desiring : V**
 - ▶ **thirst_V_Desiring : V**
 - ▶ **want_V_Desiring : V**
 - ▶ **yearn_V_Desiring : V**
- ▶ Swe: [Roberte]Experiencer [LÄNGTADE] [hem till Tyskland]Focal_participant
 - ▶ **längta_V_Desiring : V**

Desiring_V2 : Experiencer_NP → Focal_participant_NP → V2 → Clause

- ▶ Eng: [you]Experiencer [WANT] [one]Focal_participant
 - ▶ **covet_V2_Desiring : V2**
 - ▶ **crave_V2_Desiring : V2**
 - ▶ **desire_V2_Desiring : V2**
 - ▶ **fancy_V2_Desiring : V2**
 - ▶ **want_V2_Desiring : V2**
 - ▶ **yearn_V2_Desiring : V2**

Future work

- Add more languages
 - Cooperation needed
- Separate LU-governed **prepositional objects** from adverbial modifiers (*Adv* vs. *NP* arguments)
- Differentiate syntactic **roles of VP FEs** (object vs. adverbial modifier)
- Include shared **non-core FEs** (via a modified comparison algorithm)
- Align **LUs** among languages (e.g. via GF translation dictionaries) ✓
- Towards FrameNet parsing in GF
 - First, frame labelling
 - FrameNet grammar as an **embedded CNL** in RGL
 - Restrict **LUs to frames** (by using GF dependent types)
 - Later, semantic role labelling (SRL)

Constructicon

- Somewhere between the syntax and lexicon
- **Lexical units:** *word*-meaning pairs (FrameNet)
 - Incl. fixed multi-word expressions
- **Constructions:** *form*-meaning pairs
 - Each construction contains at least one variable element
 - At least one fixed element? OR Everything "above" the lexicon?
- An example: *make one's way* (WAY_MEANS) [1]
 - Structure: {^{Motion} verb [Verb] [^{PossNP}]}
 - Evokes: MOTION
 - [Theme *They*] {*hacked their way*} [Source *out*] [Goal *into the open*].
 - [Theme *We*] {*sang our way*} [Path *across Europe*].
 - *Hopefully* [Theme *he*]'{*make his way*} [Goal *to our location*].

Multilinguality

- Berkeley Constructicon (BCxn)
 - A pilot project (~70 constructions)
- Swedish Constructicon (SweCxn)
 - An ongoing project (~300 constructions so far), inspired by BCxn
- Brazilian Portuguese Constructicon, few other constructicons
 - Ongoing projects, inspired by BCxn
- Translation is not always compositional
 - A multilingual constructicon would help to make it compositional ("again") [2]
- *Constructions with a referential meaning may be linked via FrameNet frames, while those with a more abstract grammatical function may be related in terms of their grammatical properties.* [3]

GF Translator:

[4]

SweCxn:

Why GF?

- Constructions is a mixture of lexical units and syntactic rules – there is no formal distinction between lexical and syntactic functions in GF; it fits the nature of constructicons
- The support for multilinguality
- Constructicon as an embedded grammar
- An extension to the GF FrameNet grammar and lexicon

Implementation in GF

- **Automatic normalization and consistency checking**
 - Feedback (errors and warnings)
- **Automatic generation of the abstract syntax**
 - For each construction, 1..N functions
 - Alternative/optional variables vs. alternative/optional lexical units
- **Automatic generation of the concrete syntax (partial)**
 - By systematically applying the high-level RGL constructors
 - And limited low-level means (ToDo)
 - Pseudo syntax → Actual syntax
 - Feedback (success and failures)
- **Manual verification and completion (ToDo)**
 - Requires a good knowledge and linguistic intuition of the language (Swe) and, preferably, a corpus; low-level knowledge of RGL

Abstract syntax

- *behöva_något_till_något*
 - Type: VP
 - Structure: [*behöva*..1 NP_1 *till*..1 NP_2 | VP]
 - Detailed description (partial):
 - {cat=V, role=State, lu=behöva..1}
 - {cat=NP, role=Requirement}
 - {cat=P, lu=till..1}
 - {cat=NP | Pn | VP, role=Recipient}
- fun behöva_något_till_något_VP_1 : NP -> NP -> VP
- fun behöva_något_till_något_VP_2 : NP -> VP -> VP

Concrete syntax

- Many constructions can be implemented by systematically applying the high-level RGL constructors
 - A parsing problem: which constructors in which order?

Construction	Elements	Patterns
behöva_något_till_något_VP_1	behöva_V NP_1 till_Prep NP_2	V NP Prep NP
behöva_något_till_något_VP_2	behöva_V NP_1 till_Prep VP	V NP Prep VP

Pseudocode

```
mkVP (mkVP (mkV2 mkV) NP) (mkAdv mkPrep NP)
```

A simple GF grammar
(might need some manual probs)

The parser failed at token VP (no example justifies the V NP Prep VP case)

Final code (by automatic post-processing)

```
lin behöva_något_till_något_VP_1 np_1 np_2 = mkVP
  (mkVP (mkV2 (mkV "behöver")) np_1)
  (SyntaxSwe.mkAdv (mkPrep "till") np_2) ;
```

Running example

```
* * *
*      *
*
*
*      * * * * *
*      *
*      * * * * *
*      *
*      * * * *
*      *
*      * * *
*      *
*      * * *

Implementation in GF

To Do:

1. Extend and apply the automated approach to all types of constructions in SweCxn
2. Conduct a manual / corpus-based evaluation
3. Write a paper to GEAF and/or some other venue (LREC 2016, ICCG, ...)
 - Integration with the FrameNet grammar
 - Mapping to the BCxn (a shared abstract syntax)
